MSM514260C/CSL

262,144-Word × 16-Bit DYNAMIC RAM : FAST PAGE MODE TYPE

DESCRIPTION

The MSM514260C/CSL is a 262,144-word × 16-bit dynamic RAM fabricated in Oki's silicon-gate CMOS technology. The MSM514260C/CSL achieves high integration, high-speed operation, and low-power consumption because Oki manufactures the device in a quadruple-layer polysilicon/single-layer metal CMOS process. The MSM514260C/CSL is available in a 40-pin plastic SOJ or 44/40-pin plastic TSOP. The MSM514260CSL (the self-refresh version) is specially designed for lower-power applications.

FEATURES

- 262,144-word × 16-bit configuration
- Single 5 V power supply, ±10% tolerance
- Input : TTL compatible, low input capacitance
- Output : TTL compatible, 3-state
- Refresh : 512 cycles/8 ms, 512 cycles/128 ms (SL version)
- Fast page mode, read modify write capability
- $\overline{CAS}$ before $\overline{RAS}$ refresh, hidden refresh, $\overline{RAS}$-only refresh capability
- $\overline{CAS}$ before $\overline{RAS}$ self-refresh capability (SL version)
- Package options:

40-pin 400 mil plastic SOJ	(SOJ40-P-400-1.27)	(Product : MSM514260C/CSL-xxJS)
44/40-pin 400 mil plastic TSOP	(TSOPII44/40-P-400-0.80-K)	(Product : MSM514260C/CSL-xxTS-K)

xx indicates speed rank.

Notes:

1. A start-up delay of 200 µs is required after power-up, followed by a minimum of eight initialization cycles ($\overline{RAS}$-only refresh or $\overline{CAS}$ before $\overline{RAS}$ refresh) before proper device operation is achieved.

2. The AC characteristics assume t_T = 5 ns.

3. V_{IH} (Min.) and V_{IL} (Max.) are reference levels for measuring input timing signals. Transition times (t_T) are measured between V_{IH} and V_{IL}.

4. This parameter is measured with a load circuit equivalent to 2 TTL loads and 100 pF.

5. Operation within the t_{RCD} (Max.) limit ensures that t_{RAC} (Max.) can be met. t_{RCD} (Max.) is specified as a reference point only. If t_{RCD} is greater than the specified t_{RCD} (Max.) limit, then the access time is controlled by t_{CAC}.

6. Operation within the t_{RAD} (Max.) limit ensures that t_{RAC} (Max.) can be met. t_{RAD} (Max.) is specified as a reference point only. If t_{RAD} is greater than the specified t_{RAD} (Max.) limit, then the access time is controlled by t_{AA}.

7. t_{OFF} (Max.) and t_{OEZ} (Max.) define the time at which the output achieves the open circuit condition and are not referenced to output voltage levels.

8. t_{RCH} or t_{RRH} must be satisfied for a read cycle.

9. t_{WCS}, t_{CWD}, t_{RWD}, t_{AWD} and t_{CPWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}$ (Min.), then the cycle is an early write cycle and the data out will remain open circuit (high impedance) throughout the entire cycle. If $t_{CWD} \geq t_{CWD}$ (Min.) , $t_{RWD} \geq t_{RWD}$ (Min.), $t_{AWD} \geq t_{AWD}$ (Min.) and $t_{CPWD} \geq t_{CPWD}$ (Min.), then the cycle is a read modify write cycle and data out will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, then the condition of the data out (at access time) is indeterminate.

10. These parameters are referenced to the $\overline{UCAS}$ and $\overline{LCAS}$, leading edges in an early write cycle, and to the $\overline{WE}$ leading edge in an $\overline{OE}$ control write cycle, or a read modify write cycle.

11. These parameters are determined by the falling edge of either $\overline{UCAS}$ or $\overline{LCAS}$, whichever is earlier.

12. These parameters are determined by the rising edge of either $\overline{UCAS}$ or $\overline{LCAS}$, whichever is later.

13. t_{CWL} should be satisfied by both $\overline{UCAS}$ and $\overline{LCAS}$.

14. t_{CP} is determined by the time both $\overline{UCAS}$ and $\overline{LCAS}$ are high.

15. Only SL version.
